

Plant Biology

Energy Conversion

Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen. These reactions sustain plant growth and support food webs across terrestrial ecosystems.

Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen. These reactions sustain plant growth and support food webs across terrestrial ecosystems.

Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen. These reactions sustain plant growth and support food webs across terrestrial ecosystems.

Process	Location	Result
Reaction 1	Chloroplast membrane	Energy transfer
Reaction 2	Chloroplast membrane	Energy transfer
Reaction 3	Chloroplast membrane	Energy transfer

Process	Location	Result
Reaction 4	Chloroplast membrane	Energy transfer
Reaction 5	Chloroplast membrane	Energy transfer
Reaction 6	Chloroplast membrane	Energy transfer

Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen. These reactions sustain plant growth and support food webs across terrestrial ecosystems. Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen. These reactions sustain plant growth and support food webs across terrestrial ecosystems. Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen. These reactions sustain plant growth and support food webs across terrestrial ecosystems. Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen. These reactions sustain plant growth and support food webs across terrestrial ecosystems. Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen. These reactions sustain plant growth and support food webs across terrestrial ecosystems.

Ecosystems

Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen. These reactions sustain plant growth and support food webs across terrestrial ecosystems. Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen. These reactions sustain plant growth and support food webs across terrestrial ecosystems. Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen. These reactions sustain plant growth and support food webs across terrestrial ecosystems. Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen. These reactions sustain plant growth and support food webs across terrestrial ecosystems. Photosynthesis converts light energy into chemical energy in plant cells. Chlorophyll absorbs sunlight inside chloroplasts. Water and carbon dioxide are used to produce sugars and release oxygen.
